Finding SNAP Payment Errors Faster in Idaho

October 26, 2026 (corrected; first version October 23) · State brief · Cory Trimm

> **Corrected October 26, 2026.** The October 23 version of this brief overstated the tool's results. Its models used the benefit the agency issued alongside income, deduction and household-size values that, in the federal QC file, are what the QC reviewer recorded, so they could partly see the error (experiment 106). Every model figure here comes from the October 26 rebuild: leak-free inputs (experiment 107), trained and scored on the errors that count toward the official payment error rate: errors the QC reviewer found whose amount is over the federal tolerance (experiments 111–112). Figures computed directly from the QC data (error rates, error patterns, caseload shares) were not affected.

Summary

Idaho's FY2025 payment error rate was 3.85%, the second lowest of 53 jurisdictions and below the 6% line where H.R. 1 cost sharing begins. Idaho owes nothing under FY2028 rules at that rate. For Idaho the tool is about staying below the line and using a small review staff well.

- **It finds 2.3 times the error dollars of random review,** counting the errors the official payment error rate counts (over the federal tolerance). Reviewers working the top 20% of the tool's queue would find about **$29 per review hour against $13**. The top 10% finds 2.2 times.
- **It holds up over time.** Trained on 2020–22 and tested on 2023–24, it kept a 2.5× edge. Expected error dollars for the top fifth of the queue were 16% above actual.
- **It's fair by design.** Ranking purely by dollars would review elderly households at 0.35 of their share of error cases. A floor brings that to 1.08, at a cost of about 18% of the lift (2.3× → 1.9×).
- **Underpayments:** 27% of Idaho's error dollars are households paid too little (national 28%).

- **Cheap insurance:** at its current rate Idaho owes nothing. In the model, about 1,300 ranked reviews a month (4.6 FTEs) would bring a rate of 6.5% back under 6% (see *FY2028 cost share*).

Recommendation: a shadow pilot. Score the active caseload, have reviewers work the top of the queue alongside current selection with the fairness floor on, and compare the dollars found with the tool's forecast.

Idaho's errors

Federal QC public-use files, FY2020–2024: 3,839 reviewed Idaho cases. Shares are of cases with any error found, including small ones, and are unweighted:

	Idaho	National
Reviewed cases with an error found	33.7%	37.9%
Error cases: over / under	785 / 507	61% / 39%
Error dollars that are underpayments	27%	28%
Largest shares of error dollars	Wages and salaries 29%, Shelter deduction 25%, RSDI benefits 12%	Wages and salaries 37%, Shelter deduction 16%, Unit composition 8%
Most frequent errors (share of error cases)	Shelter deduction 43%, Wages and salaries 21%, Child support received 5%	Shelter deduction 31%, Wages and salaries 24%, RSDI benefits 7%
Errors coded as reporting or timing issues (nature code 97)	64%	42%
Errors coded "other" (nature code 99)	12%	5%

	Idaho	National
Error cases with no per-error dollar amount recorded	37.9%	50.4%

Idaho's errors are dominated by the shelter deduction and by timing.

- **Shelter:** shelter-deduction errors are 43% of error cases (national 31%).
- **Timing:** 64% of errors carry the reporting or timing code (national 42%).
- **Social Security:** Social Security (RSDI) income carries 12% of error dollars, about twice the national share.
- **Small amounts:** the median error is $17, against $28 nationally.

What the tool does

Each month the tool scores every active case using only information the agency already has before any review:

- reported income and earnings;
- deductions, housing and utility costs;
- household size;
- the household's maximum allotment.

It does not use the benefit the agency issued: in the federal QC data that would let it compare the issued amount with the reviewer's corrected facts (experiment 106).

It estimates the chance the case has an error over the federal tolerance (the kind the official payment error rate counts) and how many dollars it would be. It multiplies them to get expected error dollars, and orders the review queue by that number.

Idaho's model learns from every state's QC cases plus Idaho's maximum allotments. Among the 53 jurisdictions, Idaho ranks 50 on the top-20% lift, 52 on the top-10% lift and 45 on the later-years test (1 = best).

Results on cases the model never saw

960 Idaho cases (25%) were set aside before training:

Review the top…	Error dollars vs random	Found per review hour (random)	Forecast vs actual	Rank of 53
10% of the queue	**2.2×**	$27 ($13)	90% over	52
20% of the queue	**2.3×**	$29 ($13)	16% over	50
20%, trained 2020–22, tested 2023–24	2.5×			45
20%, with the fairness floor	1.9×			

Error dollars here are those over the federal tolerance. Reviews are assumed to take 30 minutes. The 53-jurisdiction median is 2.96× (top 20%).

Fairness

The measure is each household type's share of reviews divided by its share of cases with an error over the tolerance (its error risk), where 1.0 means reviewed in proportion to risk:

Household type	Dollars only	With the floor
Elderly	0.35	1.08
Disabled	0.58	0.78
Single parent	1.53	1.03
Childless adult	1.38	1.25

The floor costs about 18% of the lift. We recommend it on by default.

Underpayments

A second ranker trained on underpayments finds 1.6 times the underpayment dollars of random review, against 1.2 times for the main ranker (both trained on Idaho's own cases; exp79, leak-free, official definition).

Flag cards for reviewers

Idaho is where the flag cards have been tested most outside Pennsylvania and New York:

- **Odds:** the cards' "N in 10" odds were recalibrated on Idaho cases (exp74).
- **Rules line:** tested at scale on fresh Idaho, Utah and South Dakota cards (exp97), with 100% agreement with the large model.
- **Where to look:** that model beat generic advice in Idaho after about 100 labelled error cases (exp63).

Rechecked without the leak (exp108): the odds recalibration holds in Idaho (error 0.22 → 0.08), and the top three "check first" items cover 88% of flagged errors, against 82% for a fixed list of Idaho's three most common error locations. The exp63 result was measured on the earlier models.

FY2028 cost share

H.R. 1 sets the state share by payment error rate: 0% under 6%, 5% at 6–8%, 10% at 8–10%, and 15% at 10% or more. We modelled reviews as removing a share of the caseload's error dollars each month (cases reviewed × the tool's lift × the share fixed), with errors otherwise lasting until recertification. All assumptions were fixed before results existed (exp69, exp93).

At 3.85%, Idaho pays nothing. **How much a higher rate would cost:** Idaho's SNAP benefits are about $282 million a year. Assumptions are the same as the national model's central scenario: 2% of cases reviewed a month, 80% of found errors fixed, errors otherwise lasting 6 months.

If Idaho's rate were…	Share owed	Cost a year	Rate after ranked reviews (≈1,300 a month, 4.6 FTEs)	Rate after random reviews
3.85% (FY2025)	0%	$0	3.27%	3.51%
6.5%	5%	about $14M	5.52%	5.93%

If Idaho's rate were…	Share owed	Cost a year	Rate after ranked reviews (≈1,300 a month, 4.6 FTEs)	Rate after random reviews
8.5%	10%	about $28M	7.22%	7.76%

Ranked reviews bring 6.5% back under 6%; random reviews of the same volume bring 6.5% back under.

These figures show the size of the opportunity, not a forecast. The model leaves out:

- timing relative to the federal sample month;
- procedural errors outside the public file;
- behavior changes;
- the cost of reviews.

A pilot in Idaho

1. **Month 0:** map the case-management fields to the tool's inputs (13 fields plus the maximum allotment) and score the active caseload. The model runs on a laptop.
2. **Months 1–3, shadow:**
    - **Review:** reviewers work a sample from the top of the queue alongside current case selection, with the fairness floor on.
    - **Random slice:** about 10% of reviews on randomly chosen cases.
    - **Record:** the dollars found and the error type.
3. **Read-out:**
    - dollars found against the forecast;
    - dollars per review hour against current selection;
    - how long found errors had lasted and the share fixed (the two cost-share drivers).
4. **Refresh yearly** on the new federal QC sample plus the pilot's findings.

Limitations

- **Public data only.** The model was built from federal public-use files, whose income and deduction fields are the QC reviewer's values; for error cases those are the corrected facts, while a deployed tool sees the agency's uncorrected ones. Validate on Idaho's own pre-review case records before relying on these numbers.
- **Scenarios, not forecasts.** See the cost-share caveats above.
- **Small errors.** Idaho's errors are small (median $17), so dollars found per review hour are low even when the lift is good. The case for a pilot rests on accuracy and staying below 6% more than on dollars.
- **The policy library doesn't cover Idaho yet.** It holds 1 Idaho SNAP document (the FY2026 SNAP Employment and Training state plan, amendment 1). Rule citations on flag cards would need Idaho's SNAP manual added first.
- **The tool prioritizes; it doesn't decide.** Every determination stays with a reviewer.
